

Q. How you cross check installed git version?

-> by using `git --version` command

Q. Which command is used to know the git configuration?

-> `git config --list` or `git config -l` command

Q. Which command is used to check the status of local repository?

-> `git status`

Q. What is use of "git init" command?

-> To initialize an empty git repository

Q. I have added four new files F1.txt,F2.txt,F3.txt and F4.txt file in working directory. If I check status of local repository then what is status of repository?

-> There are 4 untracked Files (F1.txt,F2.txt,F3.txt,F4.txt)

Q. F1.txt file is untracked,I want to add this file into staging area,How will you add this F1.txt File into staging area?

-> We will add F1.txt file into staging area by using "git add" command as below  
`git add F1.txt`

Q. There are 3 untracked files and I want to add these all 3 files into staging at a time then how will you add all these files into staging area?

-> To add untracked into staging area use "git add" command as below  
`git add --a`  
or  
`git add .`

Q. Suppose I have 10 files in working area,some are text file,some log files some are pdf files.Write git commands for below requirement

1) Add only text files into staging area

-> `git add *.txt`

2) Add only log files into staging area

-> `git add *.log`

3) Add only pdf files into staging area

-> `git add *.pdf`

Q. Suppose, In staging area there are four files say F1.txt, F2.txt, F3.txt and F4.txt  
Write git commands for below requirement

1) add F1.txt file into commit area or commit F1.txt

-> git commit F1.txt -m "F1 is committed"

2) commit F2.txt

-> git commit F2.txt -m "F2 is committed"

3) commit all staged files.

-> git commit -m "All files committed"

Q. Suppose I have A1.txt File, status of this file is untracked, now I am adding A1.txt file into staging area so I have written below command, now guess what will happen if below command is executed? I mean which File get added in the staging area?

-> git add a1.txt

Explanation: Here we are trying to add "a1.txt" file into staging area. If "a1.txt" is available then it get added into staging area. If file is not available then we will get an error.

-> Note: File name is case sensitive. i.e A1.txt and a1.txt are not same, both files different.

#### # Unstage a file:

-> with the help of "git add" command we add untracked and modified files into staging area. If we want to unstage a file then we have different commands

1) git rm

2) git restore

3) git reset

#### 1) git rm command

Case A: git rm command with --cached option

Case 1: unstage one file at a time

Syntax: git rm --cached File\_name

Example: git rm --cached f1.txt

Case 2: unstage multiple files at a time

Syntax: git rm --cached File1\_name File2\_name File3\_name

Example: git rm F1.txt F2.txt F3.txt

Note: git rm with --cached option remove the files from staging area and place back into working area but it is not removing from our system.

### Case B: git rm command with -f option

-> git rm with -f option command do two operations.

- 1) remove file from staging area.
- 2) delete the file from system.

-> Syntax: git rm -f File\_name

Example: git rm -f F1.txt file

When above command is executed then first F1.txt get removed from staging area and then it is deleted from system(working area)
