

```
Author identity unknown
*** Please tell me who you are.

Run

git config --global user.email "you@example.com"
git config --global user.name "Your Name"
```

If you are getting above error means your user name is not configured.

you can configure your user name in two ways

- 1) Through the "git config" command
- 2) Through the "Credentail Manager"

First Way: Configure user name and mail id through the "git config" command.

Step 1: open gitbash

Step 2: execute below command to set mail id

```
git config --global user.email "your mail id"
```

Example:

```
user.email "dhajare191@gmail.com"
```

Step 3: To configure user name execute below command

Syntax:

```
git config --global "user name"
```

example:

```
git config --global "rrd-tnp"
```

Note: while configuring user name and email, user name value and email value should be single or double quote

Step 4: To cross check configuration is success or not.

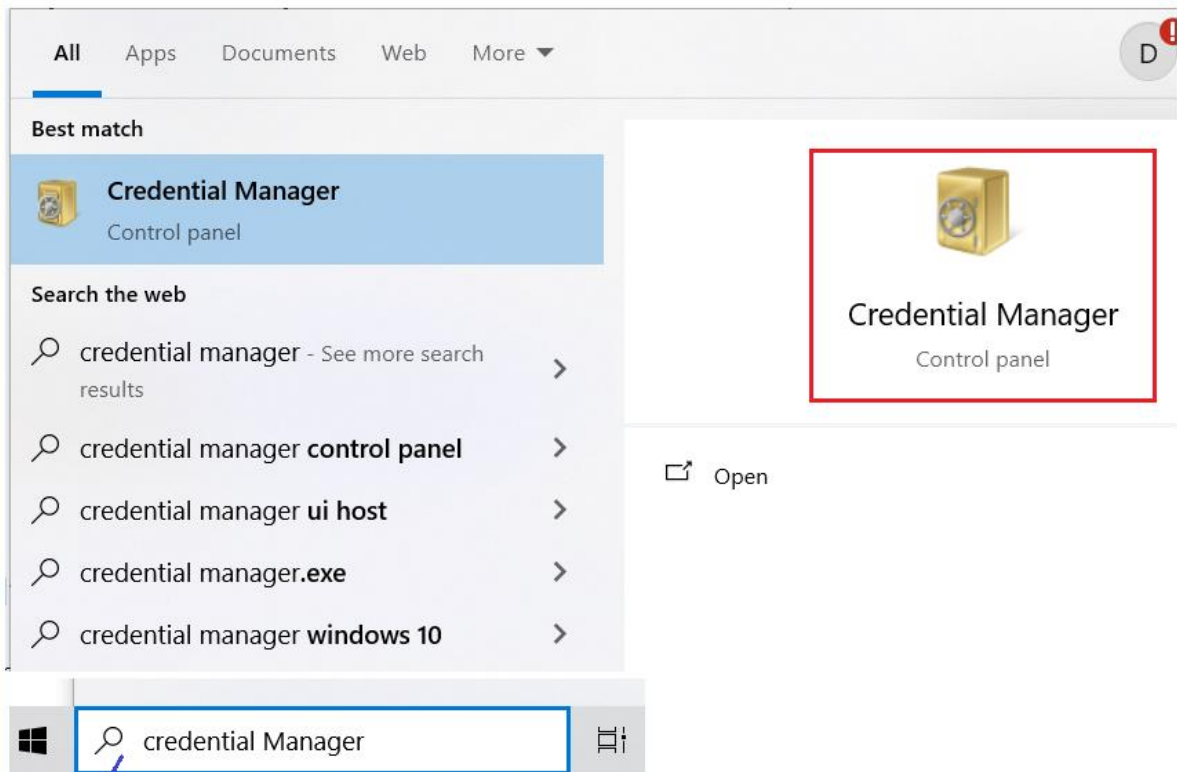

Execute the below command

```
git config --list
```

out put of git config --list command

```
credential.helper=manager  
credential.https://dev.azure.com.usehttppath=true  
init.defaultbranch=master  
user.email=dhajare191@gmail.com  
user.name=rrd-tnp  
advice.usecorefsmonitorconfig=true  
core.fsmonitor=true  
core.repositoryformatversion=0  
core.filemode=false  
core.bare=false
```

Second way to set user name: Credential Manager

In search box search -Credential Manager

Manage your credentials
View and delete your saved login information for websites, connected applications and networks.

Internet or network address: githttps://github.com

User name: rrd-tnp your user name

Password: your password

Persistence: Local computer

Edit Remove

If github entry is not exist then click here and add the below details

URL: [git:https://github.com](https://github.com)

User Name: [your github user name](#)

Password: [your github password](#)

Persistence: [Local Computer](#)

If these entry is not there then click on "Add a Generic Credentials"

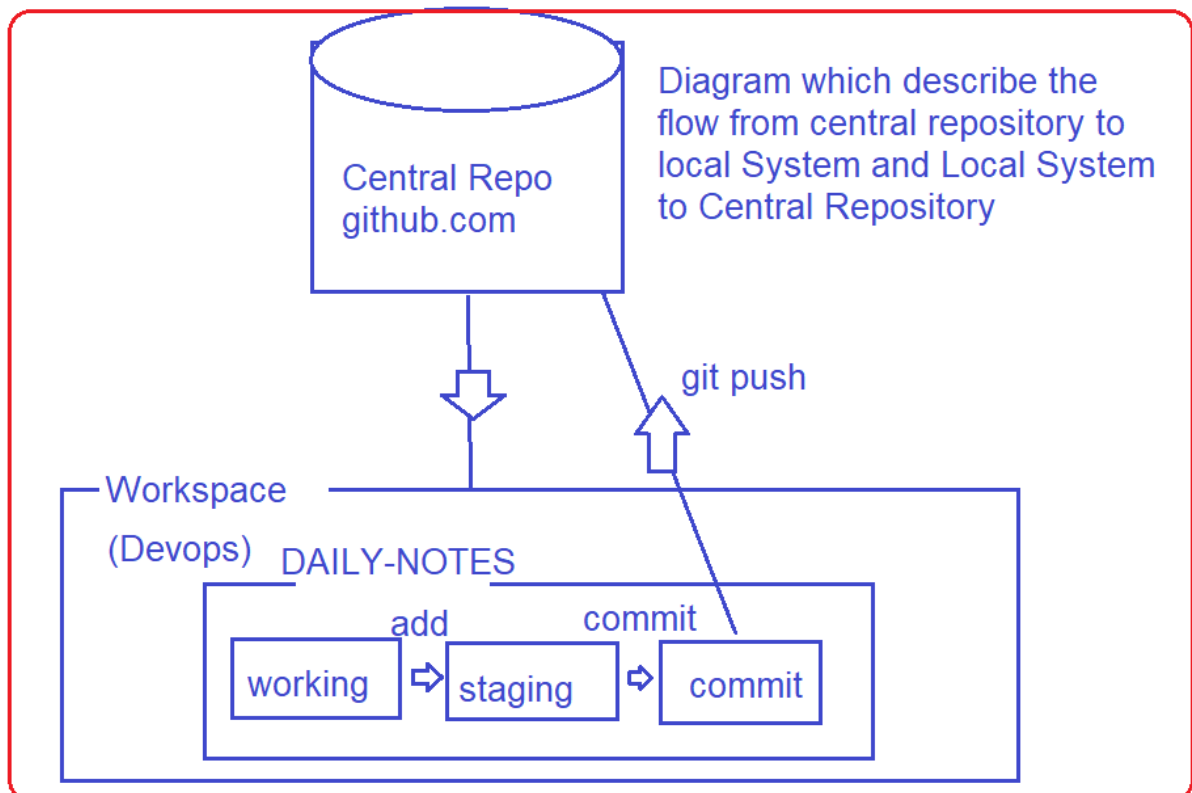

MicrosoftAccountuser=dada.hajare17@gmail.com Modified: 10-10-2023

Case 1: Cloneing existing central repository on local system

1. Go to your workspace folder(**Devops**)
2. Open **gitbash** and execute below command
Syntax : git clone repository_url
Example: git clone <https://github.com/RRDTNP/DAILY-NOTES.git>

Case 2: Push your local Repository changes to central Repository

1. Go to your local repository Folder and open gitbash
1. Add your modified files into staging area by using below command
git add command.
2. Add your changes into commit area by using
git commit command
3. push your local repository changes to central repository by using **"git push"** command

Case 3: Creating your own branch on github

1. Login to github account.
2. Browse your required Respository(TASKS)
3. Click on "**Braches**" tab -> On right-side you have "**New Branch**" button Click on that button

Create a branch

New branch name

specify-your-branch-name

Source

release_aug_2024 select source branch

Cancel Create new branch

click here

4. Specify your branch name and source branch(**release_aug_2024**) and click on Create Branch Button.

Case 4: Cloneing created branch on local system.

1. Go to your workspace folder(Devops)
2. Open gitbash in workspace folder
3. To clone a branch execute "git clone " command

Syntax : git clone -b branch_name repository_url

Example:

```
git clone -b feature-aug-ddh https://github.com/RRDTNP/TASKS.git
```

Note: If your are cloneing any repository's branch first time on your local system. then we have to use above command.

Next time onward if we want to clone other branch of same repository then use below command

git checkout branch_name

or

git switch branch_name

Note: If repository is already available or branch is already available on local system and we want to clone other branch of same repository then use "git checkout" or "git switch" command.

Case 5: push the local branch changes to central repository branch.

1. go to local repository(TASKS)
2. open gitbash
3. Cross check your current branch by using "git branch" command.
4. Add modified files into staging area
5. Add modified files into commit area.
6. Finally push the changes to central repository by using "git push" command.
